

Running the Application

Using Visual Studio Code:

1. Open Visual Studio Code
2. Select File → Open Folder, and open the folder containing the LiftUp files
3. Open a terminal inside VS Code (Terminal → New Terminal)
4. Run application with:
`python liftup_main.py`

This will launch the Tkinter application window.

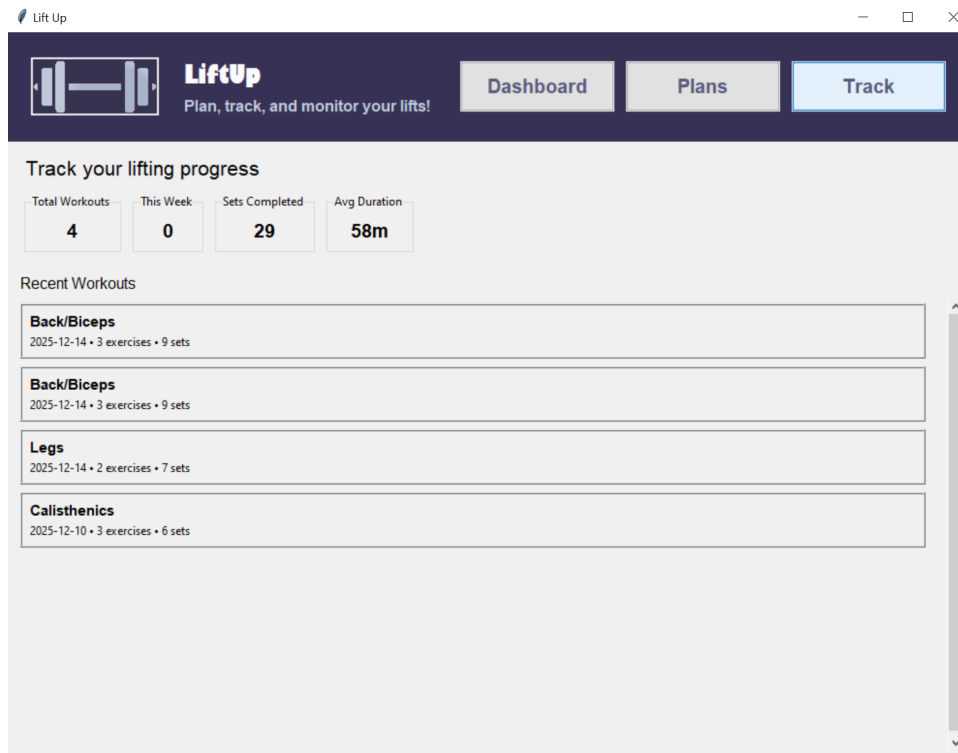

Fig 1. Launched application and Dashboard page.

This application has three main pages that can be navigated with the three buttons that are permanently at the top of the window. These pages' functions can all be navigated with explicitly labeled buttons, text entries, and pop ups. The application can be closed anytime the same way as any other terminal.

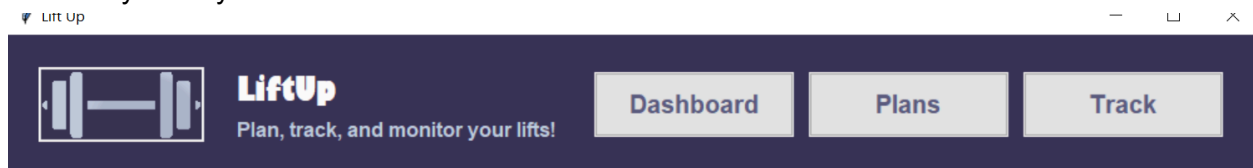

Fig 2. Application main navigation buttons.

Three main pages of the application:

- **Dashboard**

This is the home page of the application. It displays at the top: the total workouts completed, workouts completed during the current week, total sets completed, and shows the average workout duration. Below this it lists the ten most recent workouts.

- **Plans**

This is where users can create and manage custom workout plans. They can view their already existing plans and edit them, or create a new plan. When editing or creating a plan, the user can define the plan name, exercise names, and the target sets including the amount of weight and reps. The user can add as many exercises they want, with as many sets they want.

- **Track**

This is where users can log and complete workouts based on existing plans. A plan must be created through the plans page, and exist already before selecting it. The user can select a workout plan from a droplist, and start the workout. Once the plan is started, it shows the plan set by set. It displays the targets from the plan's creation, and entries for the user to enter in their completed reps and weight. The user can skip a set, or they can complete the set to save the entered information and move onto the next portion of the workout. The user is not required to enter in their completed reps and weight when they complete the set, as it will autofill with the targets. Additionally, there is an exit button for the user to quit the workout. The user is able to switch between pages, and go back to the track page and it will keep their current workout progress.

When the end of the workout is reached, it will congratulate the user, and prompt them to save the workout. It will refresh the track page, and update the dashboard statistics information.
